PHP VS PYTHON

1995 | 1991

Architecture

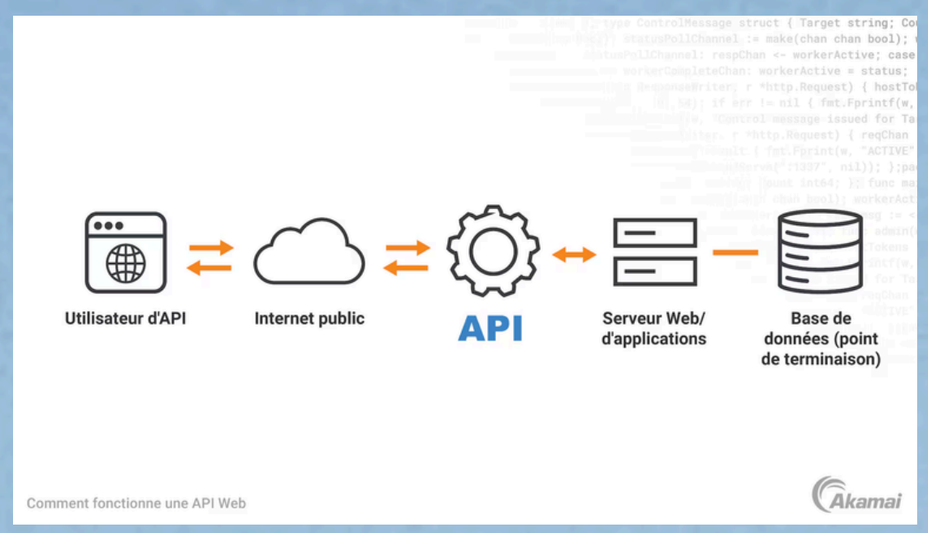
Client → Web server → script PHP → HTML

Architecture

Client → web server → Python app (framework) → réponse

Often use for :

Often use for :



```php
<?php
if ($_SERVER['REQUEST_METHOD'] === 'POST') {
    $textColor = $_POST['textColor'] ?? 'black';
    setcookie('textColor', $textColor, time() + 15);
    $backgroundColor = $_POST['backgroundColor'] ?? 'white';
    setcookie('backgroundColor', $backgroundColor, time() + 15);
    header('Location: ' . $_SERVER['PHP_SELF']);
    exit();
}
$textColor = $_COOKIE['textColor'] ?? '';
$backgroundColor = $_COOKIE['backgroundColor'] ?? '';
?>
```

```python
app = Flask(__name__)

@app.route('/')
def hello():
    return f'<h1>Bonjour BUT2 !</h1><p>Je suis une
if __name__ == "__main__":
 app.run(host="0.0.0.0", port=5000)
```

Pros :

- More options for web programming
- Frontend
- Cookies & Session
- Link with other web laguage

Cons :

- Harder to write/read
- Less versatile outside of web development
- Many more better options
- Old syntax

Pros

- **API Oriented**
- **Easier data science and AI implementation**
- **Easier to read/write**
- **Generalist**

Cons

- **No frontend**
- **Performance sometimes lower**
- **Heavier frameworks (overkill for small projects)**
